GHAITH ALKAWADRI

Web Developer — WordPress · PHP · JavaScript

Remote, based in Egypt +20 1131124952 gheith.sy@gmail.com github.com/DevWebeloper devwebeloper.com

SUMMARY

Self-taught web developer with 8+ years of remote work for clients in the US, Switzerland, France and Norway. I build custom WordPress themes from scratch in PHP, JavaScript and CSS instead of stacking plugins, and I've built Angular front-ends. Outside client work I write Linux desktop software in Python and GTK4. My GNOME theme, Aura Glass, has 120+ stars on GitHub.

EXPERIENCE

Freelance Web Developer · Remote — 2020 – Present

- **GT-AI** (gt-ai.io): built the Angular front-end for an AI voice platform on the ElevenLabs API, covering voice preview, playback and voice settings screens.
- **CRCDC Pays de la Loire** (depistagecancers.fr): built the custom WordPress theme for a French regional cancer-screening centre. The site serves the public and health professionals, with screening programme pages, a training catalogue, an events agenda and publications.
- **JAR Capital, Geneva** (jarcapital.swiss): built a custom WordPress theme from scratch for a private wealth manager, with no page builder or theme framework. Content editors update pages without touching code.
- **Other client sites:** custom WordPress builds for Cider (Paris office furniture), OmniClouds (cloud/SD-WAN provider), IPH Studios and Tania Production (video showreels, galleries, lazy-loaded media).

Web Developer · Human Rights Foundation & Oslo Freedom Forum — 2018 – 2022 · Remote

- Worked on the WordPress/PHP sites for hrf.org and oslofreedomforum.com: theme templates, custom features and front-end JavaScript/CSS.
- Built event pages for the Forum, including speaker listings, agenda/schedule filtering and livestream embeds.
- Kept the sites fast and stable during traffic spikes around major news and the annual conference.
- Worked in a large existing codebase written by other developers.

Android ROM Developer · NovaOS (XDA Developers) — 2016 – 2018

- Ported Samsung's Note FE (Android 7.0) firmware to the Galaxy J7 Prime and other budget devices. Releases passed **1,000,000+ downloads across 12 devices**.
- Fixed missing hardware support (camera, audio, graphics) by patching device trees, kernels and vendor libraries, including reverse-engineering GPU libraries to enable UI blur effects.
- Started and ran a **15,000+ member Telegram community**: user support, bug triage and testing builds.

OPEN SOURCE

- **Aura Glass** (github.com/DevWebeloper/aura-glass): frosted-glass theme for GNOME Shell 48–51 (GTK4 / libadwaita). Includes an interactive installer, a settings app and an adaptive mode that turns blur off on battery or under heavy GPU load. 120+ stars, 180+ commits.
- **AWCC for Linux** (github.com/DevWebeloper/awcc-linux): open-source alternative to Alienware Command Center for Linux and SteamOS. It has a Python daemon, a GTK4 app and a React plugin for Steam's gaming mode. It controls power profiles and turbo boost and shows temperatures and fan speeds, using sysfs, udev rules and systemd.
- **Syncplay Tunnel** (github.com/DevWebeloper/syncplay-tunnel): GTK4 app that routes synced video playback through a remote machine over SSH. It checks that traffic really leaves from that machine and stops playback if the tunnel drops. Python standard library only, shipped as an AppImage.

SKILLS

Web	PHP, WordPress theme development, JavaScript, TypeScript, Angular, React / Next.js, HTML, CSS / Sass, Tailwind CSS, MySQL, REST APIs
Linux & desktop	Python, GTK4 / libadwaita, Bash, systemd, udev, SSH, Git
Android	Device trees, kernel builds, HAL and vendor library debugging
Languages	Arabic (native) • English (professional working proficiency)
