SUMMARY

Developer with 8+ years of remote work for clients in the US, Switzerland and France. On the web I build Angular front-ends and WordPress sites with PHP, JavaScript and CSS. I also write and maintain open-source Linux desktop software in Python and GTK4; my GNOME theme, Aura Glass, has 120+ stars on GitHub. Before that, I ported Android firmware that passed 200k downloads.

OPEN SOURCE

- Aura Glass: frosted-glass theme for GNOME Shell 48–51 (GTK4 / libadwaita). Includes an interactive installer, a settings app and an adaptive mode that turns blur off on battery or under heavy GPU load. 120+ stars, 240+ commits.
- AWCC for Linux: open-source alternative to Alienware Command Center for Linux and SteamOS. It has a Python daemon, a GTK4 app and a React plugin for Steam's gaming mode. It controls power profiles and turbo boost and shows temperatures and fan speeds, using sysfs, udev rules and systemd.
- Syncplay Tunnel: GTK4 app that routes synced video playback through a remote machine over SSH. It checks that traffic really leaves from that machine and stops playback if the tunnel drops. Python standard library only, shipped as an AppImage.

EXPERIENCE

Freelance Web Developer · Remote — 2019 – Present

- Built the Angular front-end for **GT-AI** (gt-ai.io), an AI voice platform on the ElevenLabs API: voice preview, playback and voice settings screens.
- Built and customised WordPress sites for clients including JAR Capital (Geneva), CRCDC Pays de la Loire (France) and Cider (Paris), using theme code and visual editors.

Web Developer · XonBoard — 2018 – 2025 · Remote

- Worked on the WordPress/PHP sites for hrf.org and oslofreedomforum.com in a large existing codebase: theme templates, custom features and front-end JavaScript/CSS.
- Built the Forum's event pages, including speaker listings, schedule filtering and livestream embeds, and kept both sites stable during traffic spikes.
- Also worked on websites for other XonBoard clients.

Android ROM Developer · NovaOS (XDA Developers) — 2016 – 2018

- Ported Samsung's Note FE (Android 7.0) firmware to the Galaxy J7 Prime and other budget devices. Releases passed **200k+ downloads across 12 devices**.
- Fixed missing hardware support (camera, audio, graphics) by patching device trees, kernels and vendor libraries. Ported a GPU library from another device so UI blur effects worked on every supported device.
- Started and ran a **15k+ member Telegram community**: user support, bug triage and testing builds.

SKILLS

Web	JavaScript, TypeScript, Angular, React / Next.js, PHP, WordPress theme development, HTML, CSS / Sass, Tailwind CSS, MySQL, REST APIs
Linux & desktop	Python, GTK4 / libadwaita, Bash, systemd, udev, SSH, Git
Android	ROM porting, device trees, kernel patching, porting vendor libraries between devices
Languages	Arabic (native) • English (professional working proficiency)
